ABSTRACT

Many skin diseases have been cured by Ayurveda medicine. Visarpa is one disease of skin, in which raktomokshan [blood letting] is the best treatment the result of this treatment are Higher in day to day life practice of visarpa patient and in modern medicine visarpa symptoms same as herpes zoster.

KEYWORDS: Visarpa, Raktomokshan, Lepa, Herpes Zoster.

INTRODUCTION

Visarpa is one of the skin disease, in which rakta (blood) dhatu are affecting, so this rakta Dhatu dushti (impure blood) are present in the visarpa, so that the raktamokshan (blood letting) treatment are very effective in this disease. The lepa also very effective, because visarpa is skin disorder, so lepa is direct Contact to the skin. the Acharya charak and Sushruta both also described the visarpa Vyadhi (disease) in their Ayurveda samhita with special visarparog adhyay (chapter).

MATERIAL AND METHODS

Various literature has been collected from ayurvedic samhita. Information collected from the modern textbooks.

Additional information has also been collected from internet. charakacharya has described this disease in Chikitsasthan 21 adhyay (chapter). The name visarpa denotes the spread of disease as speed of Snake on the skin Reddish colour patches due to affected of ganglion.

Visarpa dushya charaka described in chikitsasthan\(^{[1]}\)

1. Rakta (Blood)
2. Lasika (Lymph)
3. Twak (Skin)
4. Mams (Muscle)
5. Vaat
6. Pitta

According to Sushruta 6 dushya\(^2\)
1. Twak
2. Shonit
4. Vaat
5. Pitta.

Types of visarpa according to charak\(^3\)
1. Vataj
2. Pittaj
3. Kaphaj
4. Vaat-Pittaj (Agnneya)
5. Vaat-Kaphaj (Granthi) 6.Pitta-Kaphaja (Kardama) 7.Sannipatika

According to its location visarpa is divided into three types by charakacharya\(^4\)
1. Bhahya =When vaat etc. Dosha are increases at externally is called Bahya visarpa.
2. Abhyantara=When vaat etc. Dosha are increases internally in Dhatu is called Abhyantara visarpa.
3. Bhayaabhyantara=When increases Dosha are present at both externally and internally are called Bahyaabhyantara visarpa

Similarly Acharya Sushruta states following five types of visarpa\(^5\)
1.Vattaja.
2.Pittaja.
4.Sannipatika.
5.Kshataja.
After studying the types of visarpa, it becomes essential to study the causes of visarpa. Since to be a successful physician one must know the cause of disease so as to eliminate this factor which is important while treating the patient. Acharya Charaka states them as follows:

1. Aati lavana sevan - excessive intake of salty diet.
2. Atymamla sevan - excessive consumption of sour diet.
4. Dadhi sevan.
5. Sura.
6. Vidahi and viruddha aana sevan.
7. Til, kulatha, mansa, lahsuna aaati sevan.

Symptoms 1. Vataaj
Bhram (giddiness), Pipasa (thirst), Davathu, Shool (pain), Angamard (body pain), Kamp, Vivarna (discolouration), Pipilika sanchar eva angeshu (ant on body like feeling).

2. Pittaj
Jwar (fever), Trushna (thirst), Murchha (giddiness), Chhardi (vomiting), Arochak (loss of taste), Swed (sweating), Ant-dah (int-heat), Harit-haridra-netra-mutra-varshastwam (yellowish discolouration of urine, Eye and stool.), Harit-haridra-roop-darshan (yellow object seen).

3. Kaphaj
Shitak, Shitjwar, Gaurav, Nidra, Tandra, Arochak, Pandu. Kshataj visarpa is only described by Sushrutacharya, it is like kulattha, pale reddish, burning sensation and fever etc. symptoms are present.

TREATMENT
1. Raktramokshan
Raktramokshan (blood letting) is the best treatment in visarpa. The significance of raktamokshan is that one side raktramokshan and other side remaining other treatment are equal.

Following yantra are use in raktramokshan A. vaata-dushti = shrung.
B. pitta-dushti = jaloukavacharan C. kapha-dushti = alaabu.
So, like this way raktramokshan is important and best treatment in visarpa.
2. Lepa\textsuperscript{[13]}

The quantity of lepa is \( \frac{1}{3} \)rd of thumb, the kalka(materials) are neither Oily nor dryness and neither liquid nor solid.

a) Baladi lepa\textsuperscript{[14]}
b) Dantyadi lepa\textsuperscript{[15]}
c) Hriberadi lepa\textsuperscript{[16]}
d) Mulakadi lepa\textsuperscript{[17]}
e) Gauryadi ghruta\textsuperscript{[18]}

Varunadi gana is the best in visarpa but raktamokshana also is the best in visarpa treatment according to both Sushruta and Charaka.

3. Treatment According to Dosha\textsuperscript{[19]}

1. vaa\textsuperscript{a}=oilly (Snigdha)
2. pitta=sheet(cold)
3. kapha=ruksha(dry)

4. Dos(pathya) in visarpa\textsuperscript{[20]}

Mantha- Sweet and slight sour taste sugar with Daadim. Kharjur, grapes with\textsuperscript{c}old water.

Yusha- Moong dal, masur.

Satmya aahar- yava, godhum, shaali(rice).

5. Don’ts(apathyia) in visarpa\textsuperscript{[21]}

Vidaaahi annapaan, divaswaap, krodha, vyayaam, surya, agni, pravaat Sevan.

HERPES ZOOSTER\textsuperscript{[22]}

Herpes Simplex viruse HSV-I and HSV-II produces infections involving mucocutaneous surfaces, the CNS and the visceral organs.

ETIOPATHOGENESIS

The chicken pox variolla virus enters from mucosal surface or abraded Skin to involve sensory or autonomic nerve endings. So it is transported intra axonally to the nerve cell bodies in ganglion, then this virus spreads centrifugally along the peripheral sensory nervous to involve new skin or mucosa and so expands the surface area affected.

Following resolution of primary infection the virus cannot be found in the ganglion for longer
time. Reactivation of infection may be triggered by anytime UV light, immunosuppressants or local trauma. Reactivation may be associated with changes in cell-mediated immunity. The incubation period is from 6 to 8 days.

**CLINICAL FEATURES**\(^{[23]}\)

1) Myalgia
2) Inability to eat
3) Cervical adenopathy
4) Ulcers at mouth, lip, tongue and nostrils.
5) CNS infections - Dorsal root ganglion at one side is affected. So reddish Coloured snake-like patches appear. These patches are painful, hot, reddish and some are filled by fluid.
6) The lesions may be painful and heal by crusting after ten days. They can leave scars.
7) Fragility, necrosis, bleeding and severe pain.
8) Persistent ulcerative HSV lesions are common in patients with AIDS.

**DIAGNOSIS**\(^{[24]}\)

Accurate clinical diagnosis is possible if multiple vesicular lesions on an Erythematous base are present, scrapping taken from the base of the lesion and stained with Giemsa stains.

**TREATMENT**\(^{[25]}\)

Acyclovir, antiviral drug is the first choice of drug in Herpes Zooster. Mechanism of action: Acyclovir is first phosphorylated to monophosphate.

HSV infected cells perform this step effecting because of viral coded Thymidine kinase.

Oral dose - 200mg five times daily for ten days.

HSV Encephalitis is reduced by IV Acyclovir. It is given as 10 mg per kg in one hour and repeated after 8 hours for ten days.

But new drugs valaciclovir and famciclovir are of superior efficacy, good safety and well tolerated.

**DISCUSSION**

In Ayurveda Acharya Sushtuta has described seven layers of skin while Acharya Charaka has described six layers of skin and modern science also describes the layer of skin like epidermis, dermis etc. According to sushruta seven layers of skin with layers related
diseases.[26]

1= Avabhasini -sidhma, padamkantak.
2= Lohita -Tilkalak, nyachchha, vyanga.
3= Shweta -charmadala, Ajagalli, mashak.
4= Tamra -Kilas, kushtha.
5= Vedinee -Kushtha, Visarpa.
6= Rohini -Granthis, Arbud, Apachi, shleepad, Galgand.
7= Mansadhara -Bhagandara, Vidradhi, Arsha.

So in this visarpa are present in fifth vedinee skin layer.
In visarpa affected area are reddish in colour, painfull, itching sensation at that particular area like this symptoms also present in Herpes zoster.
So visarpa are as comparision with the herpes zoster.

CONCLUSION
The visarpa is a skin disorder in which the snake like one sided reddish Pathes present, which is painfull, itching sensation, overheat at that specific region are same symptoms in the herpes zoster. So the visarpa is in comparrision with herpes zoster.
