ABSTRACT

Two precise, simple, accurate, reproducible, rapid and economical UV spectrophotometric methods have been developed for simultaneous estimation of gabapentine and mecobalamine in tablet dosage form by using 0.1N HCL as solvent. Method I is based on formation and solving of simultaneous equation method, known as vierordt’s method. Gabapentine and mecobalamine show absorbance maxima at 283 nm and 274 nm respectively, so absorbance was measured at the same wavelength for the estimation of gabapentine and mecobalamine in tablet combination. Method II is based on principle of Q-analysis, known as absorbance ratio method. Absorbance was measured at 285 nm (isobestic point) and 274 nm (λmax of Methylcobalamin.).

gabapentine and mecobalamine obeys beer’s law in the concentration range of 5 to 30 μg/ml. Percentage estimation of gabapentine and mecobalamine in tablet dosage form by method I is 99 and 99.85 and by method II is 99 and 99.89 respectively with standard deviation ≤2.

Methods are validated according to ICH guidelines and can be applied for routine analysis of drugs in tablet dosage form.

KEYWORDS: Gabapentine and mecobalamine.
INTRODUCTION

![Gabapentin](image1.png)

**Fig. 1: Gabapentin.**

Gabapentin (GBP) (1-(amino methyl) cyclohexaneacetic acid), is an antiepileptic drug which is a structural analogue of neurotransmitter γ-amino butyric acid (GABA). Methylcobalamin (MC) is a coenzyme form of Vitamin B12 which is biologically active.[¹] Several method are cited in literature for determination of GBP & MC individually by UV-Vis spectroscopy¹, HPLC², LC-MS³,⁵, GC-MS⁴ & HPTLC⁶ for individual drug but for combination only RPHPLC⁷ method was reported. Hence the objective of work is to develop a simple, economic & precise UV is spectrophotometric method for this combination in commercial dosage form like tablet.[²]

![Methylcobalamin](image2.png)

**Fig. 2: Methylcobalamin.**

Vitamin B₁₂, also called cobalamin, is a water-soluble vitamin that has a key role in the normal functioning of the nervous system via the synthesis of myelin.[³] Methylcobalamin is equivalent physiologically to vitamin B₁₂ and can be used to prevent or treat pathology arising from a lack of vitamin B₁₂ intake (vitamin B₁₂ deficiency). Methylcobalamin is also used in the treatment of peripheral neuropathy, diabetic neuropathy, and as a preliminary treatment for amyotrophic lateral sclerosis.[⁴,⁵]

The review of literature revealed that several methods are available for the determination of gabapentin and vitamin B₁₂ individually. Reported methods for estimation of gabapentin were Spectrophotometric⁶, HPLC⁷,⁸, HPTLC⁹, and LC-MS¹⁰ and for vitamin B₁₂ were
Spectrophotometric\textsuperscript{[1]}\textsuperscript{1}, HPLC\textsuperscript{[1]}\textsuperscript{1} and HPTLC.\textsuperscript{[1]}\textsuperscript{1} But there is no any analytical method yet reported for simultaneous estimation of these drugs in combination.

**UV Spectrophotometric method**

**Materials and Methods**

UV-Visible double beam spectrophotometer, (Jasco model 2201) with spectral bandwidth of 1 nm, wavelength accuracy of ± 0.3 nm and a pair of 1mm matched quartz cell was used. The commercially available Gabapentine and Methylcobalamin was procured from local market.

**Preparation of standard stock solution and calibration curve**

The standard stock solution of Gabapentine and Methylcobalamin were prepared by dissolving 10 mg of Gabapentine and Methylcobalamin in 0.1 N HCl in a separate 100 ml volumetric flask and final volume was adjusted with the same solvent in 100 ml of volumetric flask to get a solution containing 100 µg/ml of Gabapentine and 100 µg/ml of Methylcobalamin respectively.

Working standard solutions of 10µg/ml for Gabapentine and Methylcobalamin were scanned in the entire UV range of 200-400 nm to determine their λ\text{max}. The λ\text{max} of Gabapentine and Methylcobalamin is found to be 283 nm and 274 nm respectively and isobestic point is at 285 nm from overlain spectra as shown in Fig.3. Six working standard solutions with concentration 5, 10, 15, 20, 25, 30µg/ml for Gabapentine and Methylcobalamin were prepared in 0.1N HCl from stock solution. The absorbance of resulting solutions were measured at their respective λ\text{max} and isobestic point and plotted a calibration curve to get the linearity and regression equation as shown in Fig. 4 and 5.

**Method I (Simultaneous equation method)**

Simultaneous equation method of analysis is based on the absorption of both drugs at their wavelength maximum. Two wavelengths selected for the development of the simultaneous equation are 283 nm and 274 nm. The absorptivity values were determined for Gabapentine are 0.14621 (a\text{x}\text{1}), 0.08121 (a\text{x}\text{2}) and for Methylcobalamin are 0.07191 (a\text{y}\text{1}), 0.1771 (a\text{y}\text{2}) at 283nm and 274 nm respectively. These values are means of six estimations. The absorbances and absorptivity at these wavelengths were substituted in equation 1 and 2 to obtain the concentration of these drugs.

\[
C_{\text{Gabapentine}} = \frac{(a_x \times y_1) - (a_x \times y_2)}{a_x \times y_1 - a_y \times x_2} \quad \text{Eqn.1}
\]
Where $C_{FLX}$ and $C_{QTF}$ are concentration of Gabapentine and Methylcobalamin respectively in $\mu g/ml$. $A_1$ and $A_2$ were the absorbance of the sample at 283 nm and 274 nm respectively.

**Method II (Absorbance ratio method)**

Absorbance ratio method of analysis is based on the absorbance at two selected wavelengths, one of which is an isobestic point and the other being the absorption maximum of one of the two drugs. From overlain spectra (Fig.3) 285 nm (isobestic point) and 274 nm ($\lambda_{max}$ of Methylcobalamin) are selected for the formation of $Q$ absorbance equation (Eqn.3 and 4).

The absorptivity values determined for Gabapentine are 0.08121 ($ax_1$), 0.04958 ($ax_2$) and for Methylcobalamin are 0.17710 ($ay_1$), 0.17794 ($ay_2$) at 274 nm and 285 nm respectively. These values are means of six estimations. The absorbance and absorptivities at these wavelengths were substituted in equation 3 and 4 to obtain the concentration of these drugs.

$$c_{Methylcobalamin} = \frac{q_{M}-q_{X}*A_1}{q_{Y}-q_{X}*a_{x_1}} \quad \text{Eqn.4}$$

$$c_{Gabapentine} = \frac{q_{M}-q_{X}*A_1}{q_{Y}-q_{X}*a_{x_1}} \quad \text{Eqn.3}$$

$Q_M$, $Q_X$ and $Q_Y$ were obtained from Eqn.no.5, 6, 7 respectively.

$$Q_M = \frac{A_2}{A_1} \quad \text{Eqn.5}$$

$$Q_X = \frac{ax_2}{ax_1} \quad \text{Eqn.6}$$

$$Q_Y = \frac{ay_2}{ay_1} \quad \text{Eqn.7}$$

Where $C_{FLX}$ and $C_{QTF}$ are concentration of Gabapentine and Methylcobalamin respectively in $\mu g/ml$. $A_1$ and $A_2$ were the absorbance of the sample at 285 nm and 274 nm respectively.

**Validation of developed methods**

**Linearity**

For each drug, appropriate dilutions of standard stock solutions were assayed as per the developed method. For method I and II, the Beer-Lambert’s concentration range was found to
be 5-30 µg/ml for both Gabapentine and Methylcobalamin. The linearity data of both methods are presented in Table.1.

Accuracy
To check the accuracy of the proposed methods, recovery studies were carried out at 80, 100 and 120% of the test concentration as per ICH guidelines. The recovery study was performed three times at each level. The results of the recovery studies are shown in Table.2.

Repeatability
To check the degree of repeatability of these methods, suitable statistical evaluation was carried out. Repeatability was performed for six times with synthetic mixture. The standard deviation and coefficient of variation were calculated. The results of statistical evaluation are given in Table.2.

Intermediate Precision (Interday and Intraday precision)
The Interday and intraday precision was determined by assay of the sample solution on the same day and on different days at different time intervals respectively. The results of the same are presented in Table.3.

Limit of Detection (LOD) and Limit of Quantitation (LOQ)
The LOD and LOQ of Gabapentine and Methylcobalamin by proposed methods were determined using calibration standards. LOD and LOQ were calculated as 3.3 σ/S and 10 σ/S respectively. Where S is the slope of the calibration curve and σ is the standard deviation of response. The results of the same are quoted in Table.3.
